RATIOS AND PERCENT

Ratios and Proportions

As we mentioned in Fraction Models, a **ratio** is a way to compare two quantities. The image below shows a comparison of several sharks, and a human figure. The largest shark (Megalodon) is ten times larger than the human figure.

Figure 1: Shark Size Comparison <u>https://commons.wikimedia.org/wiki/File:Megalodon_scale.svg</u> <u>CC BY-SA 3.0</u>

Ratios can be written in words, with a colon, or as a fraction. The following ratios are equivalent. Note that ratios are typically written in reduced from; the last two examples are not reduced.

	2 to 3	2:3	2/3	4 to 6	8:12
--	--------	-----	-----	--------	------

In the shark image, we can say there's a ratio of 1:5 for man to the purple shark (Rhincodon), 1:8 from man to the red (Megalodon conservative), and 5:8 from purple to red.

Ratios can compare part to part within a group, or part to whole. It's important to know which type of comparison your ratio uses. A ratio by itself only compares the size of groups—it doesn't give the total number of items within a group.

Ratio 1A:	Ratio 1C:
If the ratio of boys to girls in a classroom is	If we have the boys to girls ratio of 2:3, and
2:3,	they give us a little more information, we can
that means for every 2 boys there's 3 girls.	get somewhere:
That doesn't tell us any information about	a. If there are 8 boys, that tells us there
how many children are in the classroom	b If there are 15 girls that tells us there
however, just that it's a multiple of 5	are 15 boys.
(assuming everyone in the classroom is	c. If there are 40 students, that tells us
either a boy or a girl). This is a part:part ratio.	there are 16 boys and 24 girls.
Ratio 1B:	Ratio 1D:
Ratio 1B: We could write the above ratio as	Ratio 1D: If we have the boys to students ratio of 2:5,
Ratio 1B: We could write the above ratio as 2:5	Ratio 1D: If we have the boys to students ratio of 2:5, and they give us a little more information we
Ratio 1B: We could write the above ratio as 2:5 if it's interpreted as the number of boys to the	Ratio 1D: If we have the boys to students ratio of 2:5, and they give us a little more information we can get somewhere:
Ratio 1B: We could write the above ratio as 2:5 if it's interpreted as the number of boys to the total number of students in the class. This is	Ratio 1D: If we have the boys to students ratio of 2:5, and they give us a little more information we can get somewhere: a. If there are 10 boys, then there are 25
Ratio 1B: We could write the above ratio as 2:5 if it's interpreted as the number of boys to the total number of students in the class. This is a part:whole ratio. This tells us there are 2	Ratio 1D: If we have the boys to students ratio of 2:5, and they give us a little more information we can get somewhere: a. If there are 10 boys, then there are 25 students.
Ratio 1B: We could write the above ratio as 2:5 if it's interpreted as the number of boys to the total number of students in the class. This is a part:whole ratio. This tells us there are 2 boys for every student; it doesn't tell us who	 Ratio 1D: If we have the boys to students ratio of 2:5, and they give us a little more information we can get somewhere: a. If there are 10 boys, then there are 25 students. b. If there are 30 students, then there
Ratio 1B: We could write the above ratio as 2:5 if it's interpreted as the number of boys to the total number of students in the class. This is a part:whole ratio. This tells us there are 2 boys for every student; it doesn't tell us who the other group of students is (just not boys)	 Ratio 1D: If we have the boys to students ratio of 2:5, and they give us a little more information we can get somewhere: a. If there are 10 boys, then there are 25 students. b. If there are 30 students, then there are 12 boys.
Ratio 1B: We could write the above ratio as 2:5 if it's interpreted as the number of boys to the total number of students in the class. This is a part:whole ratio. This tells us there are 2 boys for every student; it doesn't tell us who the other group of students is (just not boys) or the total number of students in the class.	 Ratio 1D: If we have the boys to students ratio of 2:5, and they give us a little more information we can get somewhere: a. If there are 10 boys, then there are 25 students. b. If there are 30 students, then there are 12 boys. c. If there are 14 boys, then there are 35

When we set two ratios equal to each other, we get a **proportion**. This is really how we solved examples 1C and 1D. Typically, students are taught to cross multiply to solve a proportion, although that's not the only method. (Others are equivalent, however.)

Ratio 1C revisited:	Ratio 1D revisited:
a. $\frac{2}{3} = \frac{8}{x}$ We could cross multiply, or just create equivalent fractions. To get from 2 to 8, we multiply by 4, so we multiply the 3 by 4 to get 12. b. $\frac{2}{3} = \frac{x}{15}$ To get from 3 to 15, we multiply by 5. So 2 x 5 gives us 10. c. $\frac{2}{3} = \frac{2x}{3x}$ We have a total of 40, so 2x + 3x = 40 5x = 40 x = 8 So 2 x 8 is 16 boys and 3 x 8 is 24 girls.	a. $\frac{2}{5} = \frac{10}{x} 2 \times 5 = 10$, so $5 \times 5 = 25$ b. $\frac{2}{5} = \frac{x}{30} 5 \times 6 = 30$, so $2 \times 6 = 12$ c. $\frac{2}{5} = \frac{14}{x} 2 \times 7 = 14$, so $5 \times 7 = 35$ and $35 - 14 = 21$

Percent

A **percent** is literally a number out of 100. So 45% is 45/100=0.45. Models for percent look like the hundredths grid used with decimals. Below are a blank percent grid and a grid showing 23%.

Any percentage problem can be solved by using the following proportion:

 $\frac{part}{whole} = \frac{percent}{100}$

In general, they all boil down to solving for either the part, the whole, or the percent. Sometimes this is "is/of" instead of part/whole. Below are examples of each of the three types of problems.

Solve for part	Solve for percent
What is 30% of 70?	What percent of 50 is 23?
x _ 30	23 x
$\overline{70} = \overline{100}$	$\frac{1}{50} = \frac{1}{100}$
100x = 2100	2300 = 50x
x = 21	x = 46%
Solve for whole	
12 is 40% of what number?	
12 40	
$\frac{1}{100}$	
<i>x</i> 100	
1200 = 40x	
x = 30
